DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on 1/21/2004 has been entered.

Allowable Subject Matter

Claims 1-24 are allowed.

Claims 1-24 are allowable over the prior art of record for at least the reason that the prior art fails to teach or reasonably suggest, regarding claims 1-15, a diffractive optical element, wherein each diffraction grating is formed on a curved surface of a substrate, and the diffraction grating from among the at least two diffraction gratings, wherein a curvature radius of the curved surface and a curvature radius of a grating surface in a portion where a grating pitch is largest, have different signs, is the one which has the smallest grating thickness, regarding claims 16-22, a diffractive optical element having a plurality of laminated diffraction gratings, wherein in one of the two diffraction gratings, an optical power attributable to diffraction and an optical power attributable to refraction of the curved surface have mutually different signs, and in the other

Application/Control Number: 09/960,283

Art Unit: 2872

diffraction grating, an optical power attributable to diffraction and an optical power attributable to refraction of the curved surface have the same sign, and the one diffraction grating has a grating thickness smaller than the other diffraction grating, and regarding claims 23-24, a diffractive optical element having a plurality of laminated diffraction gratings, comprising a first diffraction grating provided on a curved concave surface and having positive optical power, and a second diffraction grating provided on a curved convex surface and having positive optical power, wherein the first diffraction grating has a grating thickness smaller than the second diffraction grating, as set forth by the claimed combination.

The most pertinent art is Ogawa (US 6,473,232, Fig. 10), wherein two diffraction gratings 23 and 24 are formed on curved surfaces 21a and one (unnamed in the Figure) parallel to 21a, respectively. The grating with the smallest grating thickness is 23 (lines 46-67, col. 10). However, in the above optical element, in the grating with the smaller thickness, 23, and at the region where the pitch is largest (section closest to the axis O), the curvature radius of the curved surface 21a and the curvature radius of the grating surface have the same sign. Cohen (US 5,117,306, Figs.7-8) discloses diffraction bifocal lenses wherein two diffraction gratings are accumulated upon each other. However, in the embodiment of Fig. 7, the grating, PL, in which the curved surface thereof and the curved surface of the substrate upon which it is formed, have different signs, is not specified as being the one with the smallest grating thickness; and in the embodiment of Fig. 8, the second grating II is not formed on a curved surface. Cohen (US 5,120,120, Fig. 16) and Londono (US 5,260,828, Figs. 10-12) disclose a lens having a grating on each of its curved surfaces. However, they do not disclose the relation between the depths of each grating, or the sign of the diffractive power of the diffractive elements.
